
Provide information about the construct and the relevant current literature
Delineation of the construct
Choose the (latent) construct
Selection of the outcome format
Quantitative results
Qualitative results
Selection of the data basis for dimensions and items
Based on current literature (SLR)
Based on an established scale with known dimensions and items
Own studies/ considerations
Aggregation logic
Arithmetic mean
Individual weighting
This step can be skipped for qualitative outcomes
Data collection
Interviews
Data upload as PDF (In principle, this can accommodate almost any method)
Combination of interviews and data uploads
Development of the interview guide for the dimensions and items
Derivation of new questions
Questions are derived from items of established scales
Questions are derived from items of established scales measuring similar constructs
Questions are based on the items of an established scale
This step can be skipped if no questionnaire is used for data collection
Translation of the questionnaire into relevant languages
Derivation of anchor values (The type and number of anchors depend on the outcome format)
Extraction of anchor examples from empirical evidence (e.g., case studies, experiments, expert interviews, and surveys)
AI-generated or self-developed anchor values
Validation of anchor values by experts through interviews or surveys
Infrastructure selection
Use of the Architecture Shell (Only applicable to quantitative outcomes)
Development of a custom system architecture
Technical Setup
Selection of APIs and underlying AI models
Finalization of the technical setup (interview guide and anchor value import, coding instructions)
Refer to the technical appendix for guidance on a possible implementation structure
Empirical validation of the MAS (e.g., functionality, consistency, inter-rater reliability, ...)
Execution: Selection of language, questionnaire, and mode (text, voice, or data upload)
Use of the results evaluation feature
All dimensions & items have been selected
Complete (validated) questionnaire developed
Complete list of (validated) anchor values
Functional (validated) MAS
Optional step
Mandatory step
Dependent on the previous decision
Milestone
